

ETL Script

This Python ETL script will do the following:

1. Extract data from kaggle datasets in their raw CSV format.
2. Transform the CSV data into sql tables and relational model
3. Load the data into a postGres SQL.
4. Conditional logic, this script must run before the fastapi backend container to ensure the data is available for the fastapi backend hosting the agent

Google ADK Agent Runtime

This Fastapi backend will do the following:

1. Expose the Google ADK agent runtime as a callable API endpoint.
2. The Google ADK agent framework handles the session management, agent initialization and tools implementation
